What Really Happened on Broad Peak, the Deadliest High-Alpine Avalanche in More than a Decade

Reporting from the mountain and the Karakoram Brotherhood, telling the stories behind the stories of those who braved Broad Peak. Three others nearly disappeared from the mountain and the history books. Then Pakistan's rescue community saved them.

At first sunrise, the team's acclimatization rounds on Broad Peak (26,414 feet) were complete. The mountain's 13,000-foot Northeast Ridge, which rises from the Godwin Austen Glacine, has a distinctive silhouette that can be spotted from the Baltoro Glacier, the route that most trekkers and mountaineers take to reach K2 and the Gasherbrum peaks. Jon Kedrowski, Ali Sadpara, and Muhammad Hassan Jokhio had spent the previous two days at Camp 2 (20,800 feet) and the day before at Camp 3 (22,800 feet), and they were ready for the summit push. Ali Sadpara, the most experienced high-altitude climber in Pakistan, was leading. "Be fast," he said.

The team's intended route was the Normal Route, the standard line up the Northeast Ridge. Kedrowski had climbed it in 2018 and knew it well. Sadpara had climbed it many times, including as a guide. Hassan Jokhio was the least experienced of the four, but he was strong and had been training hard. The plan was to leave Camp 3 at midnight, reach the summit by mid-morning, and descend to Camp 2 before the afternoon weather arrived.

They left on time and moved well through the first section of the ridge, a steep but straightforward snow and rock climb. By 4:00 a.m. they were at the base of the Broad Peak Summit Pyramid, a 1,000-foot headwall of mixed terrain that sits between the ridge and the summit. Kedrowski was leading when he noticed that the snow on the pyramid was unusually deep. Each step required him to push through knee-deep powder before he could kick a platform for the next step. He radioed back to Sadpara, who was belaying from a rock anchor below.

Sadpara climbed to the anchor and looked at the snow above. He told Kedrowski that the conditions were dangerous and that they should turn around. Kedrowski disagreed. He could see that the snow was deep but not unstable. The pyramid was steep, but it was not overhanging. He believed they could climb it safely.

They argued briefly. Then Sadpara made a decision that would change the trip. He would not continue. He would descend to Camp 2 and wait. Kedrowski and Hassan Jokhio would go on. Sadpara would not be responsible for their choice.

Kedrowski and Jokhio continued up the pyramid. The snow was as deep as it looked, and the climbing was slow and exhausting. They reached the summit at 10:30 a.m., three hours after leaving Camp 3. They were the only people on the mountain that day.

The descent was the most dangerous part of the day. The deep snow that had made the ascent so exhausting had also destabilized the slope. Each step down the pyramid triggered small slides that pulled at their legs. Kedrowski and Jokhio moved one at a time, belaying each other through the steepest sections. They reached Camp 3 at 2:00 p.m. and collapsed into their tents.

They spent the night at Camp 3 and descended to Camp 2 the next morning. Sadpara was waiting with tea and food. He had been worried about them all night and had considered climbing back up to look for them. He was relieved to see them both safe. He told Kedrowski that he had made the right decision.

The team descended to Base Camp on August 3 and began the trek out to Askole. They had been on the mountain for 11 days. They had reached the summit of Broad Peak. They had not been caught in the avalanche that would kill eleven climbers on the mountain two days later.

Kedrowski's decision to continue to the summit was the most consequential choice of the trip. It was also the most defensible. The snow was deep, but it was not unstable. The pyramid was steep, but it was not overhanging. The risk was real, but it was manageable for two climbers who were willing to turn around if the conditions changed.

Sadpara's decision to descend was also defensible. He was responsible for the safety of his clients, and he had a duty to act on his judgment. He could not force Kedrowski and Jokhio to turn around. He could only refuse to climb with them.

The disagreement was resolved without incident. The team descended safely. The mountain was climbed. The avalanche that would kill eleven climbers on the mountain two days later did not touch them.

The Broad Peak avalanche was the deadliest high-altitude avalanche in more than a decade. It killed eleven climbers on the mountain's Northeast Ridge and Summit Pyramid. The victims included climbers from Pakistan, Nepal, and the United States. Three others — Jon Kedrowski, Ali Sadpara, and Muhammad Hassan Jokhio — were caught in the avalanche but survived. They were rescued by a team of Pakistani mountaineers who had come to the mountain to search for the missing climbers.

The rescue team was led by Sadpara's son, Sajid Sadpara, and included climbers from the Karakoram Brotherhood, a group of Pakistani mountaineers who have built a reputation for high-altitude rescue work. The team reached the three survivors on August 4, two days after the avalanche, and brought them down to Base Camp. They were then flown to Skardu and transported to Islamabad.

The avalanche struck the team's acclimatization camp at Camp 3 (22,800 feet) on the night of July 31. The cause was a serac fall.

The serac fell from the Northeast Ridge, a 1,000-foot ice cliff that sits above the camp. The ice broke off and fell onto the tents below. The impact was catastrophic. Eleven climbers were killed instantly. Three others were caught in the avalanche but survived.

The three survivors were Jon Kedrowski, Ali Sadpara, and Muhammad Hassan Jokhio. They were not in the tents when the serac fell. They were on the mountain, but they were not in the path of the avalanche. They were caught in the debris field, but they were not buried deep. They were able to dig themselves out and make their way down to Camp 2.
